### Notation:

A = area of cross section, sq. in.

b = width of section, in.

E = modulus of elasticity, psi

$F_b$  = design value for extreme fiber in bending, psi

$F_v$  = design value in horizontal shear, psi

$F_c$  = design value in compression parallel to grain, psi

$F_{c\perp}$  = design value in compression perpendicular to grain, psi

h = depth of section, in.

I = moment of inertia, in.<sup>4</sup>

l = safe spacing of supports, in.

S = section modulus, in.<sup>3</sup>

w = load, lbs. per lineal ft.

$\Delta$  = deflection, in.

Properties and weights of American Standard Board, Dimension and Timber sizes commonly used for formwork construction are based on data supplied by the National Forest Products Association.

Approximate weights listed are based on lumber weighing 35 lbs. per cubic foot.
